Project Report: Velox App

Velox is a business management application built for Ndalo Holdings Pty Ltd. Everything behind it is based on the simple idea of being able to manage different aspects of the business, such as proposals and finances, all in one place. The application was developed using JavaScript and C# in Visual Studio and includes an AI agent to support users as they work and assist with any issues, they may run into while using it. This report discusses the project developed across all three parts, how lecturer feedback was implemented and how the client's requirements were considered throughout development.

App Overview

Ndalo Holdings needed a system that is efficient, user-friendly, secure and reliable. This was an important consideration because the application is intended to handle information such as user details and financial information. Users can log in or register to access the application. Once logged in, they are presented with different options for navigating to Pipeline, Billing, Finance, Contacts and other businesses that may have been added to the application. The application is kept straightforward so that users can understand where to find the features they need. Each section has its own purpose and allows users to work with a particular area of the business. Pipeline supports proposal and business opportunity activity, while Billing and Finance provide access to financial information. Contacts allows users to manage contact details, and Businesses provides a place to manage the businesses connected to the application. Security is also considered using login functionality and role-based access. This is important because not every user should necessarily have access to every area or action within the application. The AI agent is included as an additional tool to assist users while they work, with the aim of making the application more helpful without making it harder to use.

POE Implementations and Feedback

Part 1 focused on documentation and the general implementation of the project, not only to meet the project criteria but also to meet the expectations of the client. This section focused on documenting the application and adding to the app that the group was working on. These additions included improving the home page and other important pages, ensuring that security measures were in place so that not just anyone could access sensitive information by making use of a login page and role-based access. There was also an improvement made to the AI agent to make it more user-friendly and reliable to use. The aim was to ensure that users could make use of the agent as a support tool while working through the application. Overall, the goal of Part 1 was to improve the existing application and produce a user-friendly, secure and reliable solution.

Part 2 focused on improving the work completed in Part 1 and addressing feedback that had been received. The main areas that were worked on during this part included the implementation of a database, API, hosting, GitHub pipelines and expanding role-based access to account for other possible roles. The general feedback on Part 1 was based on the documentation but also included aspects of the prototype that needed further work. These areas were addressed by making additions and improvements to the application so that it had a more complete and realistic business application feel. The database and API work also helped provide a more structured way of handling the information used by the application. This part was important because it allowed the group to build on the foundation created in Part 1 rather than starting again. The feedback helped identify what needed to be improved, while the additional technical work expanded the application and moved it closer to the intended solution.

Part 3 focused on producing the final working solution while also implementing the feedback received from Part 2. To address the feedback, the group reviewed the application and checked that the main features functioned as expected when a user logged in or registered. Tests and feature checks were carried out to review how different parts of the application appeared and behaved. This final stage also involved reviewing the work completed across the previous parts and ensuring that the application and documentation were consistent with the project requirements. The focus was on refining the solution, addressing outstanding feedback and preparing the project for its final submission.

User Guide

This user guide provides a basic explanation of how to access Velox and navigate its main sections. It is intended to help users understand where to begin and how to find the main areas of the application. The exact appearance of the screens may vary depending on the version being used.

Logging in and registering

- Open the Velox application using the link or application provided.
- If you already have an account, select the login option and enter your registered details.
- If you are a new user and registration is available, select the registration option and complete the required information.
- Submit the details and wait for the application to confirm access.

Once logged in, use the navigation options to open the section you need.

Navigating the application

- Select Pipeline to access the area used for proposals and business opportunities.
- Select Billing to access billing-related information.
- Select Finance to access the finance section.
- Select Contacts to view or manage contact information.
- Select Businesses to view and manage business records available to your account.

Working with application information

When working in a section, users should first identify the correct record before making changes. Where the application provides options to add, edit or delete information, users should complete the required fields and review the information before saving. Contact records should be linked to the relevant client or proposal where that option is available. When working with proposal-related information, users should also check that the correct business and related details have been selected. Users should take care when working with Billing and Finance information. Details such as amounts, dates and related business records should be checked before

changes are saved. Users should also sign in using their own account and only use the functionality available to their role.

Basic troubleshooting

If a user cannot log in, they should check that the correct details have been entered and confirm that they are using an existing account. If a section does not load or information does not appear as expected, the user can refresh the application and try again. If the problem continues, it should be reported to the person responsible for managing the application, together with a description of the section and action that caused the issue.

Challenges and Lessons Learned

Time management and working under tight deadlines

One of the challenges the group had to manage throughout the project was working within tight deadlines while still completing the required development, documentation and testing. The group did meet the submission deadlines, but the experience showed how important it is to plan work properly and make good use of the time available. When several tasks need attention at the same time, it becomes important to understand which tasks should be prioritised and how work can be completed efficiently without losing focus on the quality of the outcome. The group learned that better planning can make a significant difference, especially when deadlines are close. Breaking work into smaller tasks, agreeing on responsibilities and keeping track of progress can help prevent unnecessary delays. At the same time, planning alone is not enough. It is also important to work efficiently, communicate clearly and make steady progress even when the time available is limited. This experience helped the group understand how to balance working quickly with still producing work that meets the project requirements.

Continuously meeting client expectations

Another challenge was continuously making sure that the application met the client's expectations as the project developed. Feedback and requirements had to be considered throughout the different parts, which meant that our group needed to

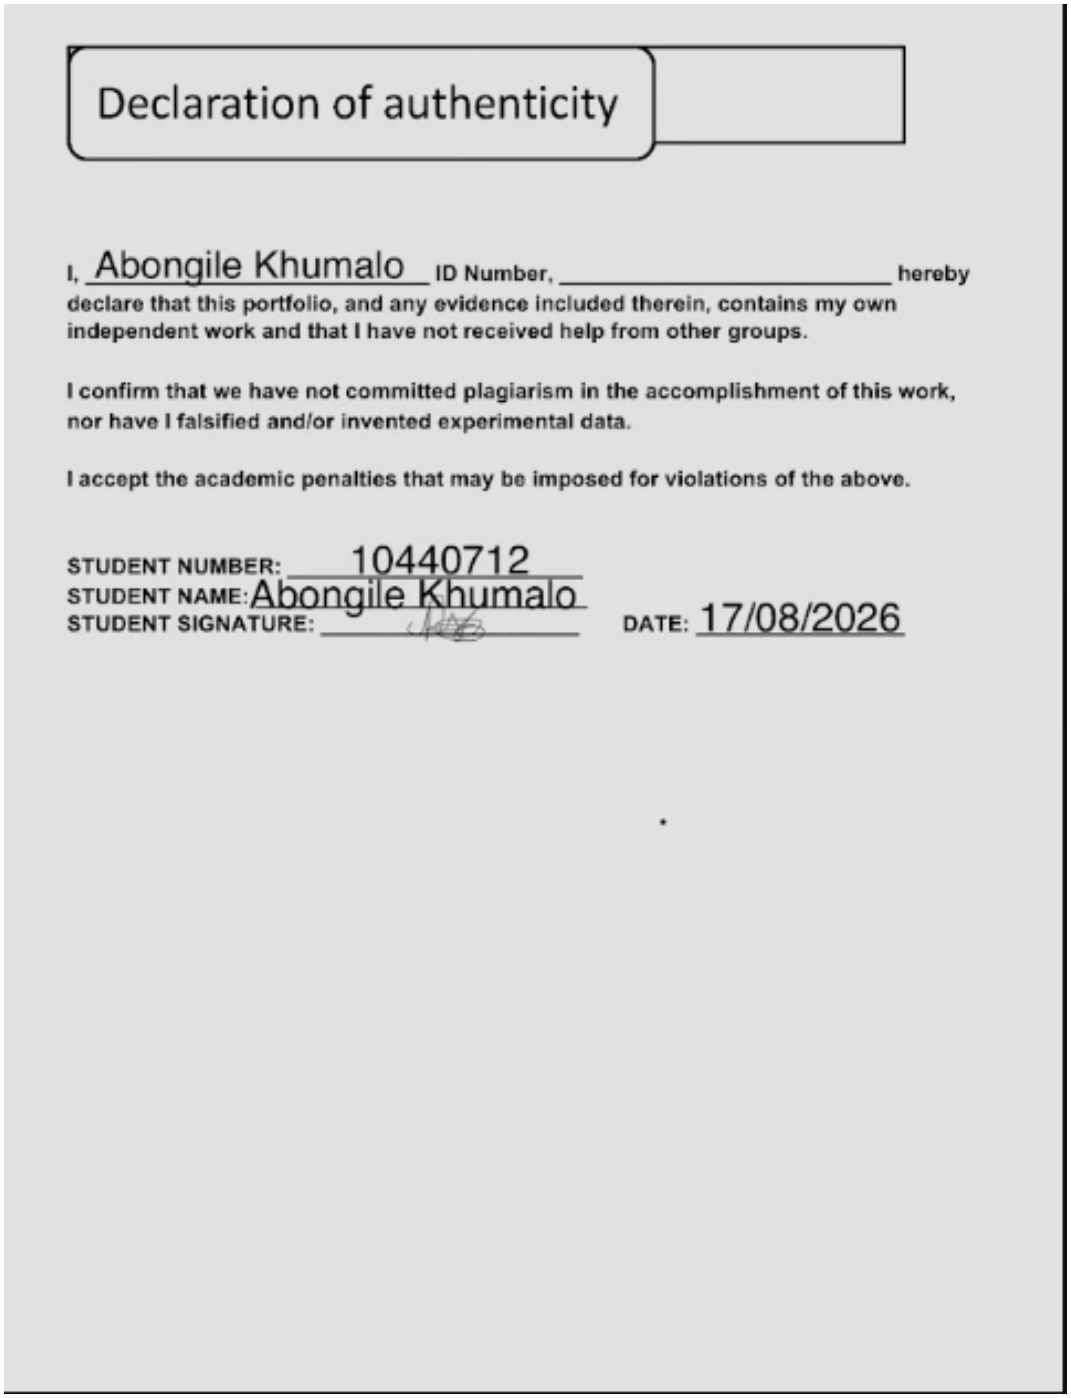

review existing work and make improvements while continuing with new development. The group learned that client expectations should remain a point of reference throughout the project, rather than only being considered at the beginning or at the time of submission. This also highlighted the importance of communication and reviewing requirements regularly. Making sure that changes still support the purpose of the application helps prevent work from moving away from what the client needs. The experience showed that meeting client expectations is an ongoing process that requires flexibility, attention to detail and a willingness to improve existing work.

Overall, the project taught the group the importance of planning ahead, managing time effectively and being efficient when working under pressure. It also showed the value of dividing tasks clearly, communicating progress and identifying problems early. For future projects, our group will continue to use these lessons by setting realistic task deadlines, allowing time for testing and documentation and regularly checking progress against the client's requirements.

Conclusion

Velox was developed from a business application concept into a more structured solution intended to support the management of business information for Ndalo Holdings Pty Ltd. Part 1 focused on documentation and the general implementation of the application, while Part 2 expanded on the features that were implemented as well as database, API, hosting and GitHub pipeline work. Lastly, Part 3 focused on reviewing the overall project, implementing feedback from Part 2 and refining the application for its final submission. Throughout the project, the group worked towards producing an application that was user-friendly, secure and useful to the client. The development process also provided experience in working with feedback, improving an existing solution and balancing different areas of project work. Although the deadlines were tight, the group completed the required submissions and learned that effective planning and efficient use of time are both important when working under pressure. The project also reinforced that meeting client expectations requires continuous attention throughout development. By considering feedback, reviewing requirements and making improvements across each part, the group was able to develop the application further and gain a better understanding of what is involved in delivering a business-focused software solution.
